useState() vs useReducer()

Generally, you'll know when you need useReducer() (➜ when using useState() becomes cumbersome or you're getting a lot of bugs/ unintended behaviors)

useState()	useReducer()
The main state management "tool"	Great if you need "more power"
Great for independent pieces of state/ data	Should be considered if you have related pieces of state/ data
Great if state updates are easy and limited to a few kinds of updates	Can be helpful if you have more complex state updates
